Introduction

There are 4 different companies offering space travel services, Space X is the most successful and affordable because it can reuse the first stage of the flight. In this project we examine the data to find the features that impact the most a successful landing to determine the price of each launch of Falcon 9 and the probability of reuse.

Section 1

Methodology

Methodology

Executive Summary

Data collection methodology:

Data was requested from SpaceX API and web scraping from Wikipedia

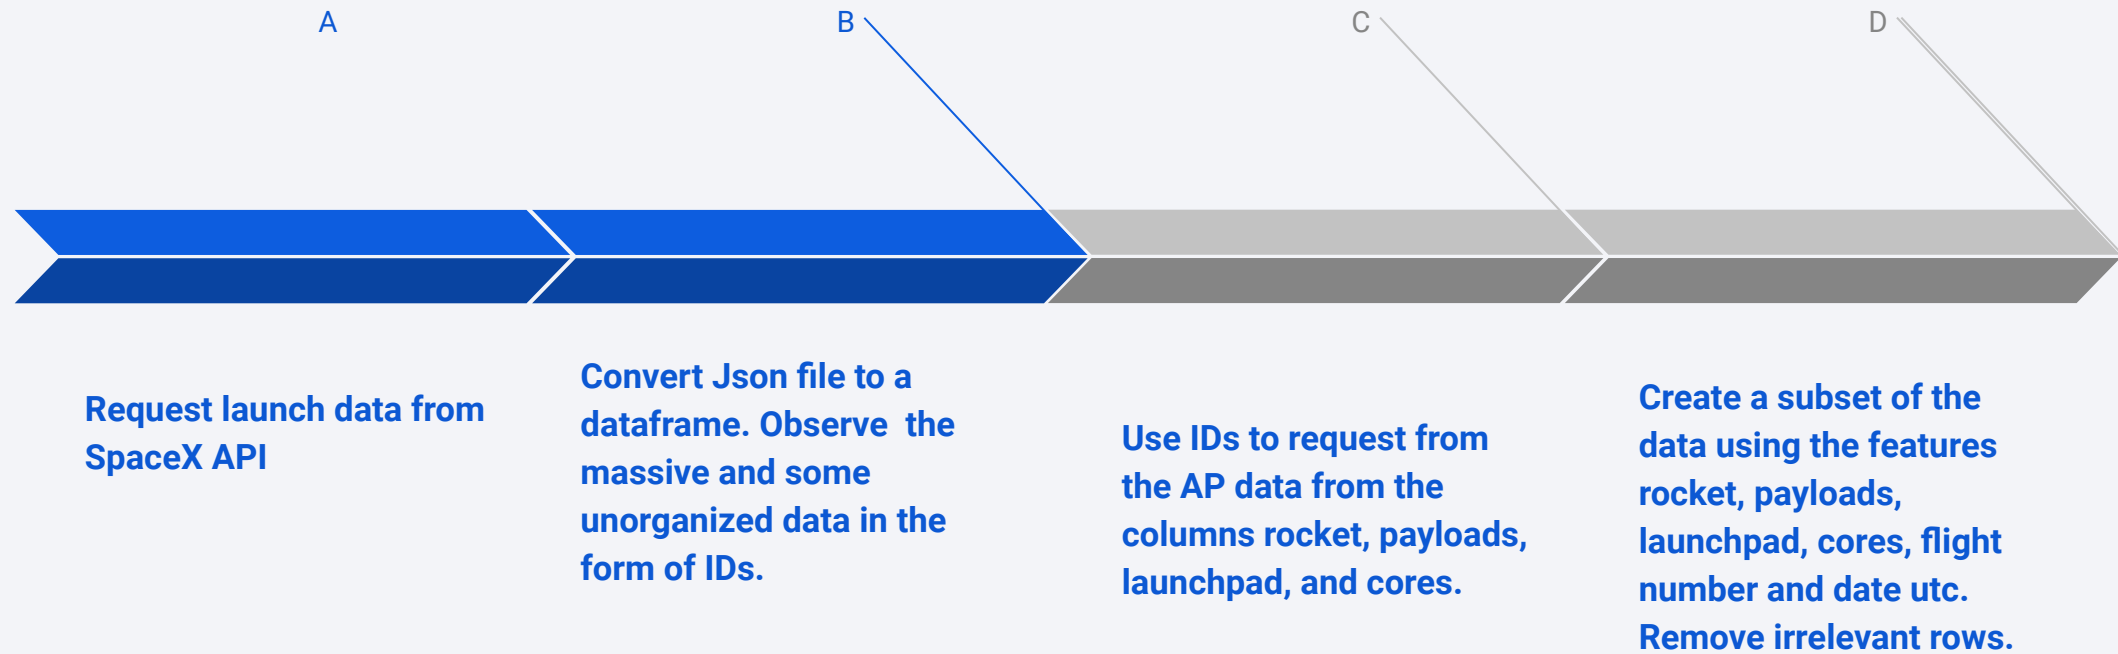

Performed data wrangling

Performed exploratory data analysis (EDA) using visualization and SQL

Performed interactive visual analytics using Folium and Plotly Dash

Performed predictive analysis using classification models

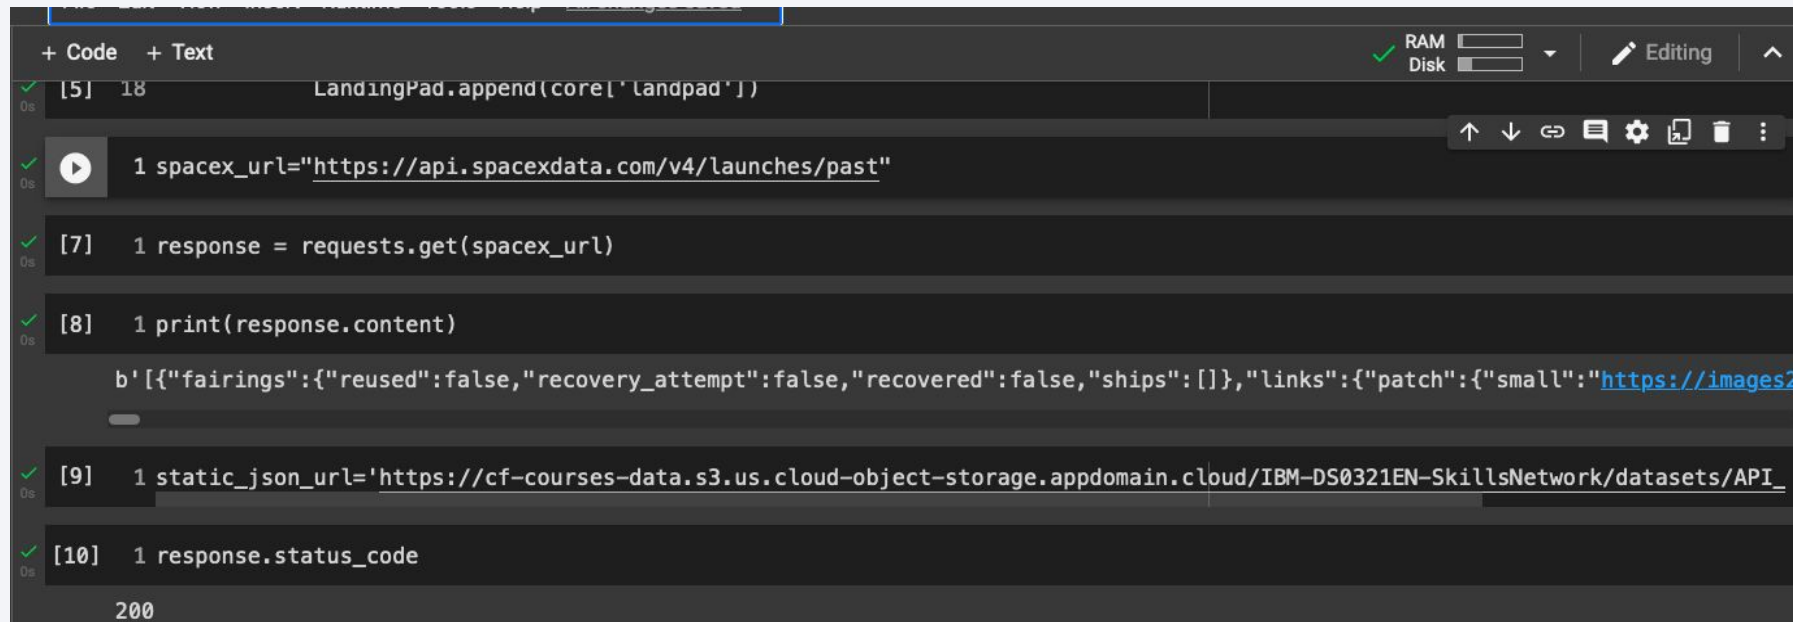

Data Collection

The data was requested from the SpaceX API and converted to a dataframe for exploration. More requests were necessary and some cleaning and wrangling was performed.

Data Collection – SpaceX API

[Github link Data Collection](#)

The screenshot shows a Jupyter Notebook interface with a dark theme. The top bar includes a '+ Code + Text' toggle, a RAM/Disk usage indicator, and an 'Editing' mode button. The notebook contains several code cells, each with a green checkmark and a '0s' execution time. The code is as follows:

```
[5] 18 LandingPad.append(core['landpad'])

[6] 1 spacex_url="https://api.spacexdata.com/v4/launches/past"

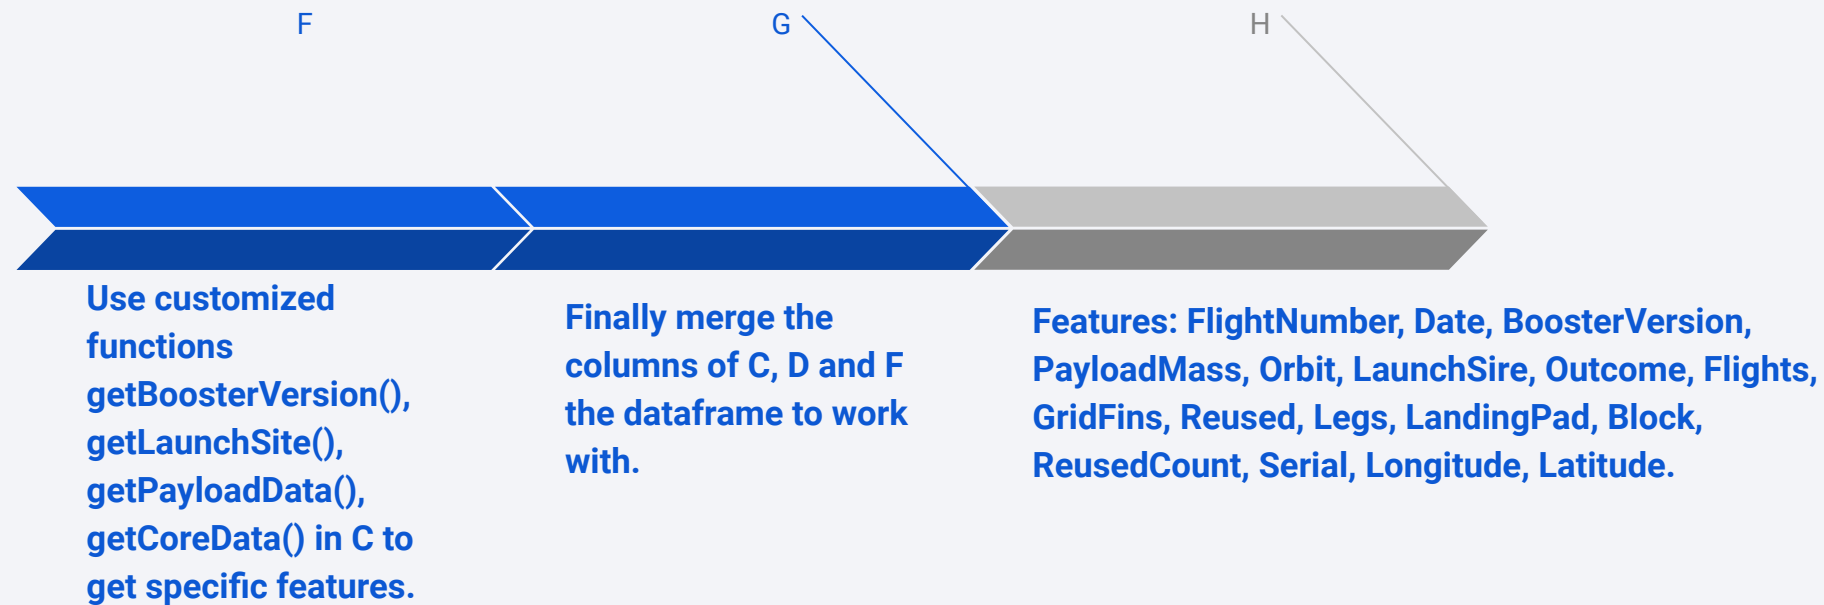

[7] 1 response = requests.get(spacex_url)

[8] 1 print(response.content)
b' [{"fairings":{"reused":false,"recovery_attempt":false,"recovered":false,"ships":[]},"links":{"patch":{"small":"https://images2

[9] 1 static_json_url='https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBM-DS0321EN-SkillsNetwork/datasets/API_

[10] 1 response.status_code
200
```

Data Collection - SpaceX API

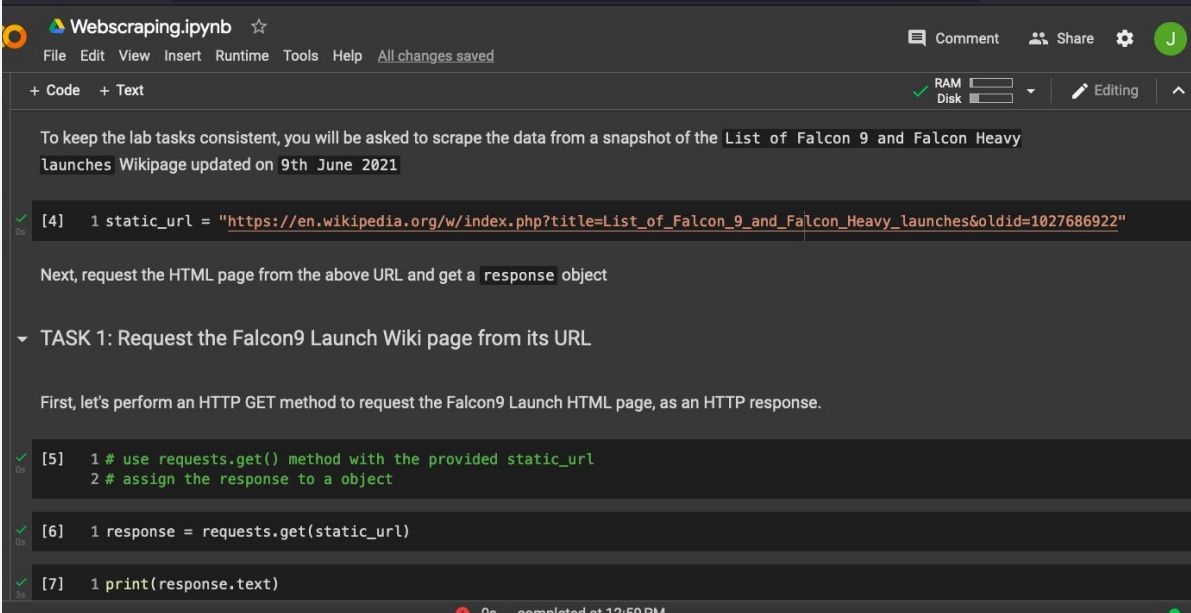

After the API request the dataframe contains the columns: 'FlightNumber', 'Date', 'BoosterVersion', 'PayloadMass', 'Orbit', 'LaunchSite', 'Outcome', 'Flights', 'GridFins', 'Reused', 'Legs', 'LandingPad', 'Block', 'ReusedCount', 'Serial', 'Longitude', 'Latitude'.

Data Collection - Scraping

- Performed web scraping to obtain Falcon 9 launch records with BeautifulSoup
- Parsed the table and converted it into a pandas dataframe.

[Github link for web scraping](#)

The screenshot shows a Jupyter Notebook interface with the title 'Webscraping.ipynb'. The notebook contains several cells with text and code. The first cell has a text prompt: 'To keep the lab tasks consistent, you will be asked to scrape the data from a snapshot of the List of Falcon 9 and Falcon Heavy launches Wikipage updated on 9th June 2021'. The second cell contains a code snippet: `[4] 1 static_url = "https://en.wikipedia.org/w/index.php?title=List_of_Falcon_9_and_Falcon_Heavy_launches&oldid=1027686922"`. The third cell contains text: 'Next, request the HTML page from the above URL and get a response object'. The fourth cell is a task description: 'TASK 1: Request the Falcon9 Launch Wiki page from its URL'. The fifth cell contains text: 'First, let's perform an HTTP GET method to request the Falcon9 Launch HTML page, as an HTTP response.' The sixth cell contains a code snippet: `[5] 1 # use requests.get() method with the provided static_url
2 # assign the response to a object`. The seventh cell contains a code snippet: `[6] 1 response = requests.get(static_url)`. The eighth cell contains a code snippet: `[7] 1 print(response.text)`. The notebook interface includes a menu bar with 'File', 'Edit', 'View', 'Insert', 'Runtime', 'Tools', and 'Help'. There are also icons for 'Comment', 'Share', and 'Settings'. A status bar at the bottom indicates 'completed at 12:59 PM'.

Data Collection Wrangling

Performed basic wrangling and the most important was to create an Outcome column which assigns 0 if bad landing and 1 if good landing were recorded.

The number of launches at each site, and the number and occurrence of each orbits were calculated as well.

[Github link Data Wrangling](#)

```
In [ ]: bad_outcomes=set(landing_outcomes.keys()[[1,3,5,6,7]])
bad_outcomes

Out[ ]: {'False ASDS', 'False Ocean', 'False RTLS', 'None ASDS', 'None None'}
```

TASK 4: Create a landing outcome label from Outcome column

Using the `Outcome`, create a list where the element is zero if the corresponding row in `Outcome` is in the set `bad_outcome`; otherwise, it's one. Then assign it to the variable `landing_class`:

```
In [ ]: def comp(list1, list2):
        for val in list1:
            if val in list2:
                return True
        return False

In [ ]: # landing_class = 0 if bad_outcome
# landing_class = 1 otherwise

landing_class = [1] * 90
i=-1

for val in df["Outcome"]:
    i=i+1
    if val in bad_outcomes:
        landing_class[i]=0

This variable will represent the classification variable that represents the outcome of each launch. If the value is zero, the first stage did not land successfully; one means the first stage landed Successfully

In [ ]: df['Class']=landing_class
df[['Class']].head(8)

Out[ ]: Class
0      0
```

EDA with Data Visualization

- Explored the data by visualizing the relationship between flight number and launch site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend. These pairs have been select to identify patterns which may affect the outcome of a launch.
- [EDA link](#)

EDA with SQL

Performed SQL queries, these are specified in the following section 2.

[Github link file](#)

Build an Interactive Map with Folium

Assigned the feature launch outcomes (failure or success) to class 0 or 1: 0 for failure, and 1 for success.

Color-labeled marker clusters identify which launch sites have relatively high success rate or low success rate..

Calculated the distances from a launch site to landmarks railways, coastlines, cities.

[Github link Map with Folium](#)

Build a Dashboard with Plotly Dash

Created an interactive dashboard with Plotly dash, please go to section 4.

[SpaceX Dashboard link](#)

Predictive Analysis (Classification)

Data loaded and normalized using numpy and pandas, then it was split into training and testing data sets.

The machine learning algorithms: Logistic regression, decision tree, SVM, and KNN were used and compared for prediction.

- [Github link for classification](#)

Results

Exploratory data analysis

Interactive analytics in screenshots

Predictive analysis (Classification)

The background of the slide is an abstract composition. It features a solid blue area on the left side, which transitions into a complex pattern of diagonal streaks and lines in shades of blue, red, and teal on the right. These streaks have a textured, almost woven appearance, suggesting a digital or data-driven theme. The overall effect is dynamic and modern.

Section 2

Insights drawn from EDA

Flight Number vs. Launch Site

As the flight number increases, the success is more likely at a specific launch site.

Payload vs. Launch Site

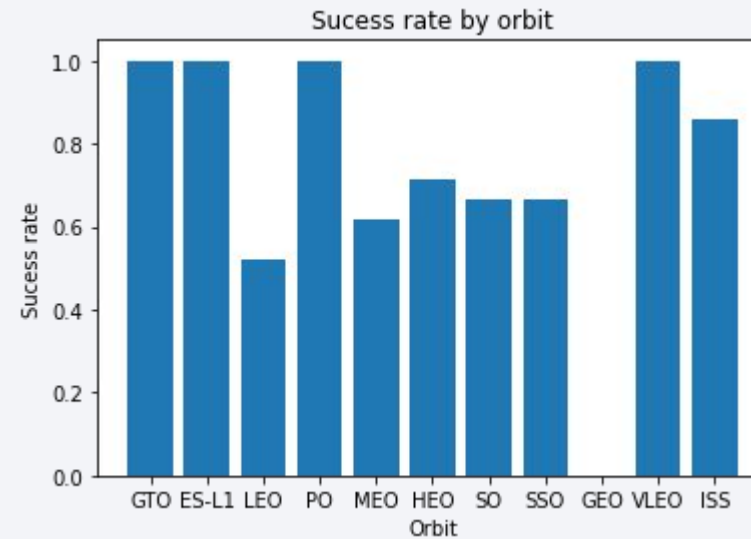

KSC LC 39A has similar more successes for light and heavy Pay loads.

CCAFS SLC 40 clearly performs better for heavy Pay loads.

Success Rate vs. Orbit Type

The orbits GTO, ES-L1, PO, and VLEO have the most success rate.

Flight Number vs. Orbit Type

Most of the first flights were failures while most of the last flights were successes. The orbits LEO, ISS, PO, and GTO improved after flight number 20.

Payload vs. Orbit Type

The orbits ISS and PO perform very good after 8000KG while VLEO does not.

Launch Success Yearly Trend

The success rate increases from 2013 until 2020.

All Launch Site Names

DISTINCT is used to show the names of all the unique launch sites

```
task_1 = '''  
    SELECT DISTINCT LaunchSite  
    FROM SpaceX  
    '''  
create_pandas_df(task_1, database=conn)
```

| | launchsite |
|---|--------------|
| 0 | KSC LC-39A |
| 1 | CCAFS LC-40 |
| 2 | CCAFS SLC-40 |
| 3 | VAFB SLC-4E |

Launch Site Names Begin with 'CCA'

5 records where launch sites begin with `CCA`

```
task_2 = '''
SELECT *
FROM SpaceX
WHERE LaunchSite LIKE 'CCA%'
LIMIT 5
'''

create_pandas_df(task_2, database=conn)
```

| | date | time | boosterversion | launchsite | payload | payloadmasskg | orbit | customer | missionoutcome | landingoutcome |
|---|------------|----------|----------------|-------------|---|---------------|-----------|-----------------|----------------|---------------------|
| 0 | 2010-04-06 | 18:45:00 | F9 v1.0 B0003 | CCAFS LC-40 | Dragon Spacecraft Qualification Unit | 0 | LEO | SpaceX | Success | Failure (parachute) |
| 1 | 2010-08-12 | 15:43:00 | F9 v1.0 B0004 | CCAFS LC-40 | Dragon demo flight C1, two CubeSats, barrel of... | 0 | LEO (ISS) | NASA (COTS) NRO | Success | Failure (parachute) |
| 2 | 2012-05-22 | 07:44:00 | F9 v1.0 B0005 | CCAFS LC-40 | Dragon demo flight C2 | 525 | LEO (ISS) | NASA (COTS) | Success | No attempt |
| 3 | 2012-08-10 | 00:35:00 | F9 v1.0 B0006 | CCAFS LC-40 | SpaceX CRS-1 | 500 | LEO (ISS) | NASA (CRS) | Success | No attempt |
| 4 | 2013-01-03 | 15:10:00 | F9 v1.0 B0007 | CCAFS LC-40 | SpaceX CRS-2 | 677 | LEO (ISS) | NASA (CRS) | Success | No attempt |

Total Payload Mass

Total payload carried by boosters from NASA

```
task_3 = '''
    SELECT SUM(PayloadMassKG) AS Total_PayloadMass
    FROM SpaceX
    WHERE Customer LIKE 'NASA (CRS)'
    '''
create_pandas_df(task_3, database=conn)
```

| | total_payloadmass |
|---|-------------------|
| 0 | 45596 |

Average Payload Mass by F9 v1.1

Average payload mass carried by booster version F9 v1.1

```
task_4 = '''  
    SELECT AVG(PayloadMassKG) AS Avg_PayloadMass  
    FROM SpaceX  
    WHERE BoosterVersion = 'F9 v1.1'  
    '''  
create_pandas_df(task_4, database=conn)
```

| | avg_payloadmass |
|---|-----------------|
| 0 | 2928.4 |

First Successful Ground Landing Date

Date of the first successful landing outcome on ground pad

```
task_5 = '''  
    SELECT MIN(Date) AS FirstSuccessfull_landing_date  
    FROM SpaceX  
    WHERE LandingOutcome LIKE 'Success (ground pad)'  
    '''  
create_pandas_df(task_5, database=conn)
```

| | firstsuccessfull_landing_date |
|---|-------------------------------|
| 0 | 2015-12-22 |

Successful Drone Ship Landing with Payload between 4000 and 6000

List of the names of boosters which have successfully landed on drone ship and had payload mass greater than 4000 and less than 6000

```
task_6 = '''
    SELECT BoosterVersion
    FROM SpaceX
    WHERE LandingOutcome = 'Success (drone ship)'
        AND PayloadMassKG > 4000
        AND PayloadMassKG < 6000
    '''
create_pandas_df(task_6, database=conn)
```

| | boosterversion |
|---|----------------|
| 0 | F9 FT B1022 |
| 1 | F9 FT B1026 |
| 2 | F9 FT B1021.2 |
| 3 | F9 FT B1031.2 |

Total Number of Successful and Failure Mission Outcomes

Total number of successful and failure mission outcomes

```
task_7a = '''
    SELECT COUNT(MissionOutcome) AS SuccessOutcome
    FROM SpaceX
    WHERE MissionOutcome LIKE 'Success%'
    '''

task_7b = '''
    SELECT COUNT(MissionOutcome) AS FailureOutcome
    FROM SpaceX
    WHERE MissionOutcome LIKE 'Failure%'
    '''

print('The total number of successful mission outcome is:')
display(create_pandas_df(task_7a, database=conn))
print()
print('The total number of failed mission outcome is:')
display(create_pandas_df(task_7b, database=conn))
```

The total number of successful mission outcome is:

| | successoutcome |
|---|----------------|
| 0 | 100 |

The total number of failed mission outcome is:

| | failureoutcome |
|---|----------------|
| 0 | 1 |

Boosters Carried Maximum Payload

List of the names of the booster which have carried the maximum payload mass

```
task_8 = '''
    SELECT BoosterVersion, PayloadMassKG
    FROM SpaceX
    WHERE PayloadMassKG = (
        SELECT MAX(PayloadMassKG)
        FROM SpaceX
    )
    ORDER BY BoosterVersion
'''
create_pandas_df(task_8, database=conn)
```

| | boosterversion | payloadmasskg |
|----|----------------|---------------|
| 0 | F9 B5 B1048.4 | 15600 |
| 1 | F9 B5 B1048.5 | 15600 |
| 2 | F9 B5 B1049.4 | 15600 |
| 3 | F9 B5 B1049.5 | 15600 |
| 4 | F9 B5 B1049.7 | 15600 |
| 5 | F9 B5 B1051.3 | 15600 |
| 6 | F9 B5 B1051.4 | 15600 |
| 7 | F9 B5 B1051.6 | 15600 |
| 8 | F9 B5 B1056.4 | 15600 |
| 9 | F9 B5 B1058.3 | 15600 |
| 10 | F9 B5 B1060.2 | 15600 |
| 11 | F9 B5 B1060.3 | 15600 |

2015 Launch Records

List of the
failed landing_outcomes
in drone ship, their
booster versions,
and launch site names in
year 2015

```
task_9 = '''  
    SELECT BoosterVersion, LaunchSite, LandingOutcome  
    FROM SpaceX  
    WHERE LandingOutcome LIKE 'Failure (drone ship)'  
    AND Date BETWEEN '2015-01-01' AND '2015-12-31'  
    '''  
create_pandas_df(task_9, database=conn)
```

| | boosterversion | launchsite | landingoutcome |
|---|----------------|-------------|----------------------|
| 0 | F9 v1.1 B1012 | CCAFS LC-40 | Failure (drone ship) |
| 1 | F9 v1.1 B1015 | CCAFS LC-40 | Failure (drone ship) |

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank of the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order

```
task_10 = '''
SELECT LandingOutcome, COUNT(LandingOutcome)
FROM SpaceX
WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'
GROUP BY LandingOutcome
ORDER BY COUNT(LandingOutcome) DESC
'''

create_pandas_df(task_10, database=conn)
```

| | landingoutcome | count |
|---|------------------------|-------|
| 0 | No attempt | 10 |
| 1 | Success (drone ship) | 6 |
| 2 | Failure (drone ship) | 5 |
| 3 | Success (ground pad) | 5 |
| 4 | Controlled (ocean) | 3 |
| 5 | Uncontrolled (ocean) | 2 |
| 6 | Precluded (drone ship) | 1 |
| 7 | Failure (parachute) | 1 |

A satellite view of Earth from space, showing the curvature of the planet and city lights at night. The image is a composite of a dark blue sky with stars and a view of the Earth's surface from space. The Earth's surface is mostly dark, with a thin layer of atmosphere visible along the horizon. The city lights are concentrated in the lower right quadrant, showing a dense network of urban areas. The text "Section 3" is overlaid on the left side of the image.

Section 3

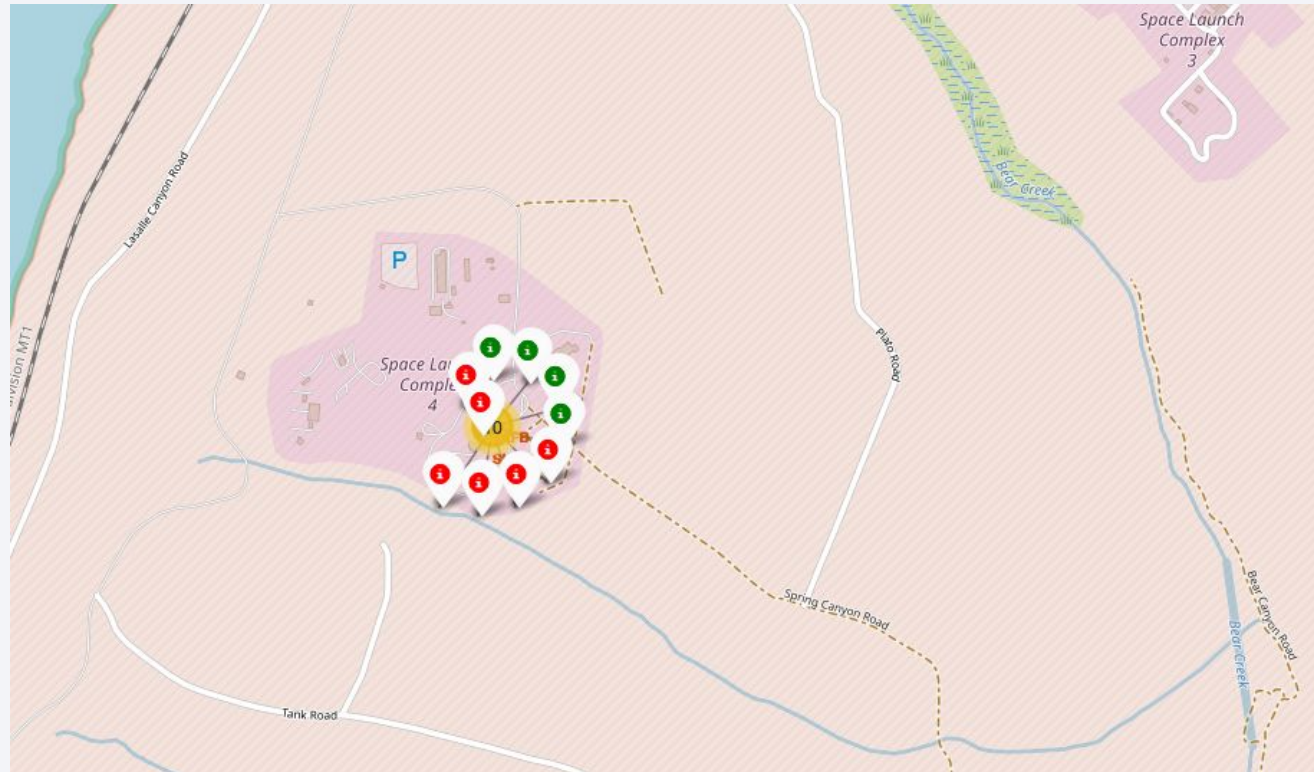

Launch Sites Proximities Analysis

SpaceX Launch Sites

California and Florida launch sites.

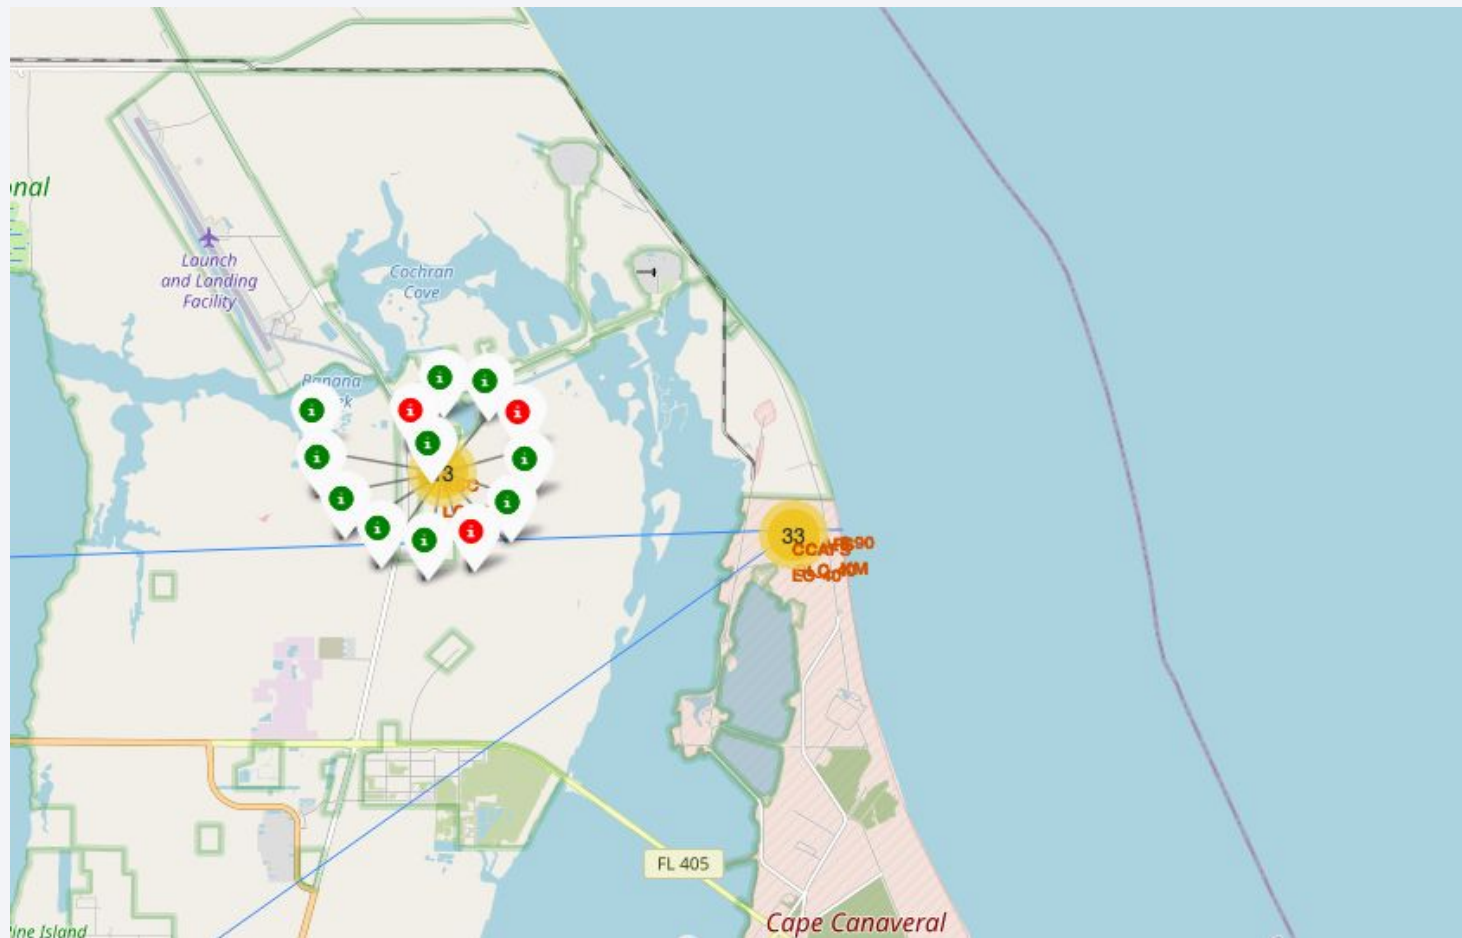

Launch sites by outcome

California **fails** and **successes**

Launch sites by outcome

Florida **fails** and **successes** launches

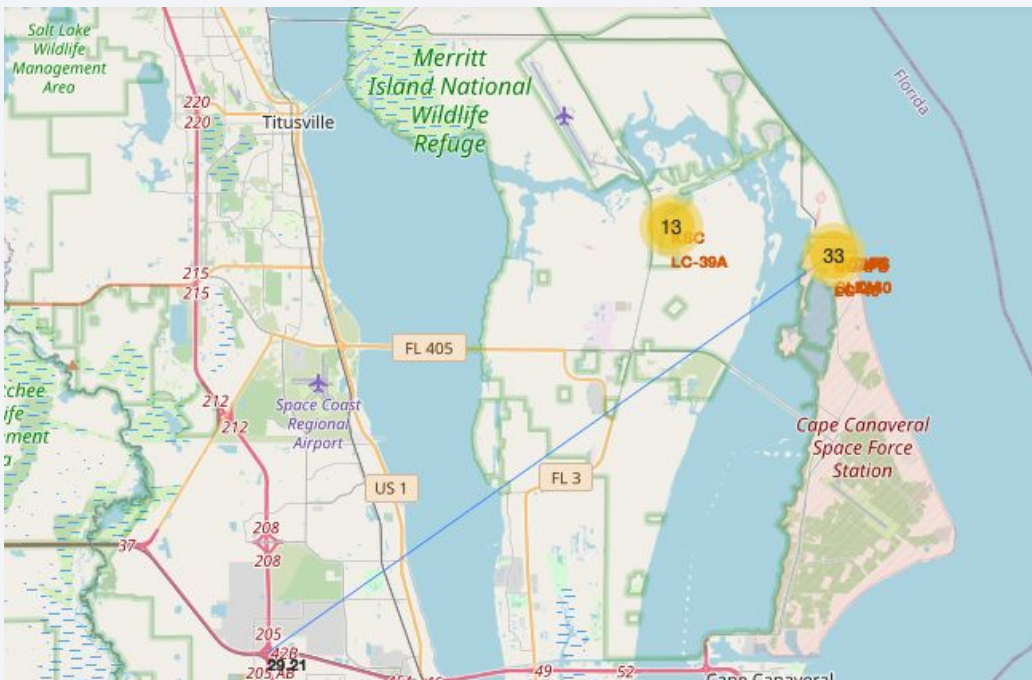

Launch Site distance to landmarks

Distance to sea

Distance to city

Section 4

Build a Dashboard with Plotly Dash

Success launches by site

Total Success Launches By all sites

KSC LC-39A has the most successful launches and CCAFS SLC-40 the lowest.

Best success ratio

Total Success Launches for site KSC LC-39A

KSC LC-39A has the best success ratio

Payload vs Launch Outcome for all sites

Successes by
Payload Mass from
365 Kg to 4990 Kg

Successes by
Payload Mass from
5200 Kg to 9600 Kg.
Failures dominates
the outcome.

A heavier payload tends to fail more than lighter.

Section 5

Predictive Analysis (Classification)

Classification Accuracy

The best classification model is **Decision Tree** method with 0.88 score of accuracy.

Confusion Matrix

- The matrix shows that the tree classifier can distinguish between the different classes. The major problem is the false positives, this is an unsuccessful landing marked as successful by the classifier.

Conclusions

- A heavier payload increases the chances of failure.
- Launch success rate started to increase steadily in 2013.
- KSC LC-39A has the most successful launch ratio among all the launch sites.
- Decision tree classifier is the best predictive machine learning algorithm for this project.

Thank you!
